## SUMMARY

Full Stack Software Engineer with 5+ years of experience designing and building scalable, high-availability, and distributed applications in financial and enterprise environments. Strong expertise in React, Node.js, and Python for developing RESTful APIs, microservices, and data-driven systems. Hands-on experience integrating AI/ML models and LLM-powered features into production applications. Experienced in deploying cloud-native applications on AWS, implementing CI/CD pipelines, and optimizing system performance.

## TECHNICAL SKILLS

**Languages:** Python, JavaScript, TypeScript, Java, SQL

**AI/ML & Data Science:** Hugging Face Transformers, Pandas, NumPy, Prompt Engineering, RAG, Vector Databases, Model Fine-tuning

**Web Development:** React.js, Redux, Node.js, Express.js, Django, FastAPI, Tailwind CSS

**Databases:** PostgreSQL, MySQL, MongoDB, Redis (Caching)

**Cloud & DevOps:** AWS (EC2, S3, Route53, SES), Docker, Terraform, GitHub Actions, Ansible, CI/CD

**Architecture:** Microservices, Distributed Systems, System Design, Scalability, High Availability

## PROFESSIONAL EXPERIENCE

**Wiwynn** Sep 2026 – Present

*Testing Engineer* El Paso, TX

- Performed integration, validation, and troubleshooting of enterprise server systems and rack-scale computing infrastructure in large-scale data center environments.
- Validated hardware and system functionality across CPU, GPU, memory, storage, and networking subsystems to ensure deployment readiness and operational reliability.
- Utilized Linux-based tools, SSH, BMC, and Serial-over-LAN (SOL) interfaces to diagnose hardware, firmware, and network-related issues.
- Conducted system-level failure analysis and root cause investigations to resolve infrastructure issues and improve system stability.
- Supported rack bring-up, server validation, hardware replacement verification, and post-repair testing activities.
- Collaborated with engineering and quality teams to analyze validation results, identify defects, and implement corrective actions.
- Performed infrastructure health checks, system monitoring, and validation procedures within production-scale data center environments.
- Documented test results, troubleshooting procedures, and technical findings to support operational excellence and continuous improvement.
- Assisted in the deployment and validation of high-performance computing and GPU-enabled server platforms.

**The University of Texas at Arlington** Jan 2026 – Sep 2026

*Full Stack Developer (Volunteer)* Arlington, TX

- Designed the payroll domain and paycheck engine in Django and React so one payroll run pays both W-2 employees and 1099 contractors, while contractors are paid hours × rate with net equal to gross and no tax withholding, benefits, or deductions.
- Defined onboarding completion rules so a contractor is payable from identity, compensation, and payment method only, and made department optional for W-2 workers without blocking payroll.
- Built pay-period processing that recalculates gross, taxes, deductions, and net when Run Payroll opens, reloads after a period is approved, and submits ACH and paper checks from the same review screen.
- Implemented check issuance so each paycheck stores a check number, print output aligns to pre-printed stock, and

duplicate check numbers no longer fail payroll submit.

- Built federal, FUTA, and state deposit flows plus Forms 941, 940, and 944 and state unemployment and SDI/PFL returns, with pre-filled filing screens for payments made in EFTPS or the state portal.
- Corrected withholding so Social Security and Medicare still calculate when federal income tax withholding is exempt.
- Designed the dashboard obligation feed so overdue deposits and filings open the exact action screen, and setup steps route to employer profile, workers, or Run Payroll.
- Shipped one responsive light UI across employer setup, payroll, tax, and sign-in, using shared layout and form styles so screens stay consistent from laptop to large monitors.

**EPAM Systems** Jan 2022 – Nov 2023
*Software Engineer* Hyderabad, India

- Led design and development of a workflow automation platform for HR operations using Node.js and React, cutting manual task handling by 40% across 3 business units.
- Architected a modular RESTful API layer with versioned contracts, enabling 6 downstream teams to independently consume services and reducing cross-team dependency delays by 30%.
- Trained and deployed a Hugging Face text classification model to auto-tag and route HR support tickets, improving categorization accuracy by 35%.
- Built a custom entity extraction pipeline using spaCy and Transformers to parse employee feedback forms, replacing 2 days of manual effort per cycle with automated structured insights.
- Owned the workflow platform's domain model and approval boundaries so HR operations across 3 business units ran on one process instead of team-specific exceptions.
- Set the API versioning and compatibility policy for 6 downstream teams, so consumers could ship against a stable contract without coordinating every HR workflow change.
- Took the ticket-routing and feedback models from prototypes to production services, defining how classification and extraction results were validated, versioned, and handed back into the HR workflow.
- Defined the release and failure model for the platform so contract breaks, bad model outputs, and workflow errors were caught before they reached HR operators or consuming teams.

## EDUCATION

**University of Texas at Arlington**
*Master of Science in Computer Science | GPA: 3.6/4* *Arlington, TX, USA*

**Visvesvaraya Technological University**
*Bachelor of Engineering in Computer Science | GPA: 8.47/10* *Bangalore, India*

## PROJECTS

**AI-Powered Document Q&A System (RAG + LLM)**

- Built a Retrieval-Augmented Generation application using LangChain, OpenAI GPT-4, and ChromaDB to enable semantic search and natural language Q&A over large document collections.
- Developed a FastAPI backend with streaming support and a React frontend with multi-turn conversation memory, replicating a ChatGPT-like experience over private documents.
- Deployed on AWS EC2 with Docker and NGINX reverse proxy; implemented FAISS-based approximate nearest neighbor search achieving sub-2-second end-to-end response times.

**Playbook** | play-book.org — Built a live equity portfolio platform solo (React/Vite, Node/Express, MongoDB, Redis) with real-capital trade theses and institutional debate features.
